

Jada Bower

What you have learned from this class:

The biggest thing I learned from this class was how to create nice graphics with the `lets-plot` library to show what information whatever dataset I'm working with contains. I also think this class would have been a great preparation for the Machine Learning class, had I not taken them at the same time. As it was, I learned most of the data manipulation and machine learning sections from that class, and when we got to those points in this class it was mostly review. But this class still helped me become more familiar with the languages and libraries of data science.

The next data science course you plan on taking:

I am not sure if this is technically a Data Science class or not, but next semester I'll be taking "Intro Statistics with R". If that doesn't count, in a few semesters I'll take "Big Data Programming".

The final grade that you are requesting is based on the work you have submitted (See the syllabus competencies for an example of a grade request paragraph.):

I am requesting an A in this class. In each of the four categories I performed well. I did extra work in the Projects, Stretches and Methods Checkpoint categories to offset the fact that I missed one DS Community task. I also often shared my code in class to help my peers.

Tasks Completed:

Projects - 35 points (A)

Project Stretches - 4 (A)

Method Checkpoints - 7 (A)

DS Community - 2 (B)
